FoCoCo Prime Tier: Auditory Goal Setting - Technical & Content Specification

Feature Name: AI-Guided Aural Confidence Goal Setting

VARK Modality: Aural (A)

Pillar: Confidence (specifically for increasing commitment, personalizing targets, and leveraging the power of spoken word)

Description: A Prime-tier feature that prompts Aural learners to verbally articulate their personal goals related to confidence and mental performance in golf. By speaking their intentions aloud, users solidify their commitment and internalize their objectives. The AI captures, processes, and verbally reinforces these goals, creating a powerful auditory anchor for their confidence journey.

I. Core Logic & AI Integration:

- **Speech-to-Text (STT) and Natural Language Understanding (NLU):**
 - **User Input:** The system captures the user's spoken goals via the device microphone.
 - **Transcription:** STT converts spoken words into text.
 - **Goal Identification:** NLU processes the transcribed text to identify specific, measurable goals related to confidence (e.g., "I want to feel more confident over 5-foot putts," "My goal is to stop negative self-talk after bogeys," "I aim to have a confident pre-shot routine on every shot").

- **Clarification Dialogues:** If the goal is unclear or too vague, the AI initiates a verbal clarification dialogue (e.g., "Can you be more specific about what 'more confident' means to you?").
- **AI Goal Storage & Verbal Reinforcement:**
 - **Goal Registration:** Once a clear goal is articulated and confirmed, the AI registers it within the user's profile.
 - **Verbal Playback:** The AI immediately plays back the user's stated goal in its own clear, confident voice, creating an auditory reinforcement (e.g., "Understood. Your goal is to: 'I will trust my putting stroke on all putts within 10 feet.'").
 - **AI-Generated Encouragement:** Adds a brief, positive verbal encouragement related to the goal (e.g., "That's a powerful goal, and completely achievable with focus.").
- **Data Sources (Prime Tier Only):**
 - **User's VARK Profile (Aural):** Prioritizes verbal input and output.
 - **Performance Data:** AI can *suggest* areas for goal setting based on performance trends (e.g., if putting metrics are inconsistent, suggest a putting confidence goal).
 - **Mindset Ratings:** If user frequently logs low confidence in specific areas, AI can prompt goal setting there.
 - **Conversational AI History:** If user discusses confidence issues, the AI can transition to goal setting.
- **Contextual Triggering:**
 - **Dedicated "Set Confidence Goal" Button:** A prominent button in the Confidence section or within the Goal Setting module.
 - **Post-Round Debrief:** If confidence was identified as a key area for improvement, the AI can prompt, "Would you like to set a new confidence goal based on today's round?"
 - **AI-Prompted Nudges:** "It's a great day to set a new confidence goal. What aspect of your mental game would you like to strengthen?" (Pushed notification).
 - **Goal Review Reminders:** AI can periodically prompt the user to verbally review their active goals (e.g., "Let's review your goal: 'I will approach every shot with unwavering commitment.'").

II. Content/Display Elements (Aural Emphasis):

1. Voice Input Interface:

- **Microphone Button:** Clearly visible, acting as the primary input trigger.
- **"Listening..." Indicator:** Visual cue (e.g., animated waveform) while the system is capturing user's speech.
- **"Processing..." Indicator:** Visual cue while the AI is analyzing the input.
- **AI Prompt (Auditory):** The AI provides clear verbal instructions (e.g., "What is your confidence goal for your golf game?", "Please state your goal clearly and positively.").
- **User Transcript (Optional):** The transcribed text of the user's spoken goal can be displayed on screen for user confirmation or review.

2. AI Verbal Confirmation & Reinforcement:

- **AI Replay of Goal:** The AI's confident TTS voice plays back the identified goal.
- **AI Encouragement:** Follow-up positive reinforcement phrases narrated by the AI.
- **On-Screen Text Confirmation:** A clear display of the verbalized goal for visual confirmation, along with a "Confirm" / "Re-state" button.

3. Goal Management View:

- **List of Active Goals:** Displays current confidence goals (can be text, but an audio playback button for each goal should be present).
- **"Listen to Goal" Button:** A small play icon next to each goal to allow users to replay their verbalized goal and the AI's confirmation.

III. UI/UX Considerations:

- **Natural Voice Interaction:** The experience should feel like a genuine conversation for goal setting.

- **High-Quality STT & NLU:** Crucial for accurately capturing and understanding nuanced verbal goals.
- **Clear AI Voice:** The TTS voice for AI prompts and confirmations must be clear, calm, and encouraging.
- **Error Handling:** Graceful handling of misinterpretations, allowing users to easily re-state or clarify their goals verbally.
- **Privacy:** Clearly communicate how voice data is used and stored.
- **Headphone Recommendation:** Suggest headphones for privacy and optimal audio quality during verbalization.
- **Repetition:** Encourage users to verbally state their goals regularly to reinforce commitment.
- **Integration with Progress Tracking:** Visually link verbalized goals to progress bars or other visual tracking features (even though this is an Aural feature, progress tracking will likely have a visual component).
