FoCoCo Prime Tier: Body Language Cues - Technical & Content Specification

Feature Name: AI-Guided Visual Confident Body Language Cues

VARK Modality: Visual (V)

Pillar: Confidence (specifically for influencing self-perception, projecting composure, and reinforcing positive mental states)

Description: A Prime-tier feature that provides AI-recommended visual tips, delivered through short videos or clear diagrams, on adopting confident posture and pre-shot body language. Designed for Visual learners, these cues help users understand and mimic the physical manifestations of confidence, thereby influencing their internal state and projecting composure on the golf course.

I. Core Logic & AI Integration:

- **Content Library:** A curated library of short videos (5-15 seconds) or high-quality static diagrams demonstrating specific confident body language cues in various golf contexts (e.g., walking to the ball, standing over a putt, after a good/bad shot, addressing the ball).
 - **Examples:**
 - "Confident Walk" (video of purposeful stride, head up)
 - "Power Posture" (diagram of strong, balanced setup)
 - "Calm Finish" (video of holding a balanced finish after impact)

- "Resilient Shoulders" (diagram showing relaxed, non-slumped shoulders)
- "Positive Gaze" (video/diagram of looking ahead, not down)
- **Data Sources (Prime Tier Only):**
 - **User's VARK Profile (Visual):** Prioritizes video and diagrammatic content over purely text-based instructions.
 - **Mindset Ratings:** If the user logs "Low Confidence," "Frustrated," or "Anxious" mindsets, the AI prioritizes relevant body language cues for self-correction.
 - **Performance Data:** While not directly tracking body language, the AI can infer potential issues (e.g., a string of poor shots might correlate with slumping shoulders, prompting a "Power Posture" suggestion).
 - **Journal Entries/Focus Logs:** User's self-reported feelings of nervousness, lack of confidence, or physical tension.
 - **AI's Trend Engine:** Identifies patterns where body language might be impacting performance or self-perception (e.g., "confidence consistently dips on par 3s, potentially indicating slouched posture").
- **AI Recommendation Engine:**
 - The AI suggests specific body language cues from its library based on the user's current needs or identified areas for improvement.
 - **Personalization Logic:**
 - If the user struggles with maintaining composure after a bad shot, suggest "Resilient Shoulders" or "Confident Walk."
 - If the user tends to look defeated, suggest "Power Posture" or "Positive Gaze."
 - If the user benefits from specific physical cues (from Kinesthetic module), the AI can link those to the visual demonstration of confident body language.
 - Recommendations come with a brief textual explanation of *why* this posture or movement helps confidence.
- **Contextual Triggering:**

- **Coach Section (Library):** A dedicated, browsable library of all body language cues, categorized (e.g., "Pre-Shot," "Post-Shot," "General Confidence").
- **Post-Round Debrief:** If confidence was an issue, AI recommends specific body language cues to practice.
- **Pre-Round Warm-up:** Suggests a quick review of 1-2 key confident body language cues.
- **AI-Prompted Learning:** "Your recent rounds show a need for stronger composure after bogeys. Review the 'Resilient Shoulders' video to learn how to physically reset."

II. Content/Display Elements (Visual Emphasis):

1. Video/Diagram Player:

- **Short Videos:** For dynamic demonstrations (e.g., showing a walk, a full setup routine). Videos should be concise (5-15 seconds), high-quality, and loop seamlessly.
- **Static Diagrams:** For clear, precise illustrations of posture or specific body parts (e.g., shoulder position, head angle). Diagrams should use clear lines, minimal text, and potentially color-coding to highlight key areas.

2. Cue Title: (e.g., "The Confident Walk," "Power Posture," "Calm Finish").

3. Purpose/Benefit: A concise textual explanation of how this body language cue helps build confidence (e.g., "Projects composure, reduces internal anxiety").

4. Key Visual/Verbal Instruction: Brief bullet points or captions directly correlating with the video/diagram (e.g., "Shoulders back, chest out," "Head up, eyes forward").

5. Call to Action: "Practice this," "Incorporate into your routine."

6. "Before & After" Visuals (Optional): For some cues, a split screen or sequential diagrams showing a "non-confident" vs. "confident" posture could be highly effective for visual learners.

III. UI/UX Considerations:

- **Dedicated Section:** A clear entry point in the Coach tab for "Body Language Cues."
- **Thumbnail Previews:** Provide small video thumbnails or diagram previews for easy Browse.
- **Full-Screen Video Playback:** For an immersive learning experience.
- **Looping Videos:** Videos should loop automatically to allow users to observe and practice.
- **Clean & Uncluttered Interface:** Minimal UI around the video/diagram to maintain focus on the visual instruction.
- **Rating/Feedback:** Users can rate the helpfulness of a cue ("Did this help you feel more confident?").
- **"Add to Practice Plan" / "Save to Favorites":** Allows users to bookmark or integrate specific cues into their practice routines.
- **AI Explanation:** When an AI recommendation is presented, a brief explanation of *why* that specific body language cue is suggested based on their data.
