Focus. Confidence. Control.

Project: App1 - GOLF

Subject: VARK - Control - (K) Kinesthetic - Interactive Routine Components

Version: 1.8.5

Prepared by: Dirk J. Delfortrie

Shared with: Imad Bouirmane

Date: July 9, 2025

FoCoCo Prime Tier: "Interactive Routine Components"

Feature Name: AI-Guided "Interactive Pre-Shot & Reset Routines"

VARK Modality: Kinesthetic (K)

Pillar: Control (specifically for reinforcing physical and mental discipline, enhancing focus through active engagement, building consistent habits, reducing impulsivity, and creating a strong mind-body connection during critical moments)

Description: A Prime-tier feature providing Kinesthetic learners with interactive elements within their customized pre-shot and mental reset routines, requiring physical confirmation of each step. Instead of passively following a routine, users will actively "tap to confirm," "swipe to acknowledge," or physically interact with the app to progress through each mental and physical action (e.g., "Tap to confirm deep breath," "Swipe to confirm target visualization," "Press to acknowledge letting go of the last shot"). This active physical engagement hardwires discipline, deepens the body-mind connection, and reinforces a controlled, step-by-step approach to every shot and moment of challenge.

I. Core Logic & AI Integration

- **Routine Step Database:**
 - **Actionable Steps:** A comprehensive library of both mental and physical steps commonly found in pre-shot routines and mental resets:
 - **Mental:** "Take a deep breath," "Visualize shot," "Commit to target," "Positive self-talk," "Let go of past shot," "Assess risk."

- **Physical:** "Address the ball," "Waggle," "Check grip," "Feel feet grounded," "Shoulder roll," "Jaw release," "Walk with purpose."
 - **Associated VARK Modalities:** Each step is tagged with its primary VARK modality (e.g., "Visualize shot" is Visual, but "Tap to confirm" makes it Kinesthetic here).
 - **Interactive Confirmation Types:** Each step can be assigned a specific physical interaction type (e.g., "Tap," "Swipe," "Press & Hold," "Double Tap").
- **Routine Builder Engine:**
 - **Custom Routine Creation:** Users build their routine by selecting steps from the database, adding their own custom steps, and arranging them in sequence.
 - **Interactive Type Assignment:** Users (or AI) assign a specific "Interactive Confirmation Type" to each step.
 - **AI-Suggested Routine:** The AI can suggest a pre-built routine based on user data (e.g., if AI detects rushing, it suggests a routine with more deliberate steps and longer holds).
- **AI Guidance & Feedback:**
 - **In-Routine Prompts:** During the routine, the app displays the current step and the required physical interaction.
 - **Real-time Interaction Tracking:** The app tracks if the user performed the "tap to confirm" action for each step within a reasonable timeframe.
 - **Adherence Analysis:** Post-round, the AI provides written feedback on routine adherence (e.g., "You completed your full pre-shot routine on 85% of holes. On holes where you skipped steps, your GIR dropped by X%.").
 - **Effectiveness Correlation:** The AI analyzes if consistent completion of the interactive routine correlates with improved "Control Score" or specific performance metrics (e.g., "When you fully completed your pre-shot routine, your driving accuracy was X% higher.>").
 - **Optimized Routine Recommendations:** Based on adherence and performance data, the AI suggests refinements to the user's routine (e.g., "Consider adding a 'physical release' step before your visualization to reduce tension detected on your drives.>").

II. Content/Display Elements (Kinesthetic & Read/Write for Setup)

1. Routine Creation/Editing Interface (Read/Write for Setup):

- **List of Steps:** Clear, editable list of routine steps.
- **"Add Step" Button:** To browse the step database.
- **"Customize Interaction" Option:** For each step, a dropdown or selection wheel to choose the "tap," "swipe," "hold," etc., confirmation.
- **Written Explanations:** For each step, a brief written explanation of its purpose.
- **"Save Routine" Button:** To store customized routines. Users can name multiple routines (e.g., "Full Pre-Shot," "Quick Reset," "Putting Routine").

2. In-Round Interactive Routine Display (Kinesthetic Focus):

- **Full Screen/Dedicated Interface:** A clean, uncluttered display showing only the current routine step.
- **Large, Clear Text for Step:** "Step 1: Take a deep breath."
- **Prominent Interactive Element:** A large, clearly labeled button/area for the "Tap to Confirm," "Swipe Here," "Press & Hold" action.
- **Visual Cues for Interaction:** Subtle animations (e.g., a glow, a pulsing effect) around the interactive area, visually prompting the required physical action.
- **Progress Indicator:** A small visual (e.g., circles, dots) at the bottom showing progress through the routine.
- **Subtle Haptic Feedback (Vibration):** A short, distinct vibration upon successful confirmation of a step, providing kinesthetic feedback without needing to look at the screen.

3. Routine Library & Review (Read/Write for Review):

- **List of Saved Routines:** Names and brief descriptions of created routines.
- **Adherence Rate:** A textual summary of how often the user completed each routine fully (e.g., "Full Pre-Shot Routine: Completed 88% of the time last week.>").
- **Performance Correlation Summary:** Textual insight on how routine adherence impacts performance (e.g., "When you completed this routine fully, your fairway percentage increased by 5%.>").

III. UI/UX Considerations

- **Responsiveness:** The interactive elements must be highly responsive to user input, providing immediate feedback.
- **Simplicity & Speed:** The in-round routine interface must be extremely simple and quick to navigate, minimizing distraction during play.
- **Offline Functionality:** All routine steps and interactive elements must work fully offline.
- **Battery Efficiency:** Optimize visual elements and haptic feedback to minimize battery drain.
- **Discreetness:** The physical interactions should be subtle enough to be performed on the course without drawing excessive attention.
- **Intuitive Design:** Users should instantly understand how to interact with each routine step.
- **User Feedback:** A quick way to rate the perceived effectiveness of a routine *after* the hole/shot.
- **Integration with Round Tracking:** The app can automatically prompt the start of a pre-shot routine before each shot if enabled.
- **Progress Reinforcement:** Positive affirmations or quick feedback messages ("Great job completing your routine!") to encourage continued discipline.
- **Accessibility:** Ensure large, clear hit targets for taps/swipes, and adjustable text sizes.
