FoCoCo Prime Tier: "Feel-Based" Drills - Technical & Content Specification

Feature Name: AI-Recommended Kinesthetic "Feel-Based" Drills

VARK Modality: Kinesthetic (K)

Pillar: Focus (with direct application to Control, Swing Mechanics, and Putting)

Description: Personalized recommendations for golf drills that emphasize the physical sensation and proprioception of a swing, putt, or other golf-related action. Designed for Prime Kinesthetic learners, these drills guide users to internalize movements and improve focus through tactile and kinesthetic awareness, with AI tailoring suggestions based on performance data and identified needs.

I. Core Logic & AI Integration:

- **Data Sources (Prime Tier Only):**
 - **User's VARK Profile (Kinesthetic):** Prioritizes recommendations for drills that involve physical sensation and movement.
 - **Performance Metrics:** Analysis of swing faults (e.g., slices, hooks), putting inconsistencies (e.g., distance control, direction), or specific shot breakdowns (e.g., fat shots, thin shots). While the app doesn't directly analyze swing mechanics, it can infer common issues from aggregated data (e.g., "missing fairways right" could suggest a fade/slice).
 - **Mindset Ratings & Focus Logs:** Correlation of focus issues with specific physical actions (e.g., "feeling rushed leading to a fast tempo").

- **Journal Entries:** User's self-reported "feelings" during good or bad shots.
- **AI's Trend Engine:** Identifies recurring physical execution issues or areas where kinesthetic awareness could improve focus.
- **AI Recommendation Engine:**
 - The AI will draw from a curated library of "feel-based" drills.
 - It will match drill recommendations to the user's specific performance challenges or focus goals, always prioritizing drills that involve a strong physical component.
 - Recommendations will include clear, concise textual instructions on *how* to perform the drill and *what sensation to focus on*.
- **Drill Content Structure (for AI Generation):**
 - **Drill Name:** Concise and descriptive.
 - **Purpose:** Explain the focus benefit (e.g., "improve tempo," "enhance clubface awareness").
 - **Instructions:** Step-by-step physical actions to perform.
 - **"Focus on This Feel":** The core Kinesthetic element – what sensation the user should be concentrating on (e.g., "feel the clubhead lag," "feel the weight transfer," "feel the putter face square").
 - **Practice Goal:** How many repetitions or how long to perform the drill.
 - **Expected Outcome:** What the user should notice (improved contact, straighter putts, better rhythm).
- **Effectiveness Tracking (User-Reported):**
 - After a user attempts a drill, they can log its perceived effectiveness (e.g., "Did this help improve your feel/focus? Yes/No/Some").
 - This feedback helps the AI refine future recommendations.
- **Contextual Triggering:**
 - **Coach Section (Drill Library):** A dedicated section for Browse various "feel-based" drills, categorized by area (e.g., Full Swing, Short Game, Putting) or focus benefit.

- **Post-Round Summary:** If the AI identifies a physical performance issue linked to focus (e.g., "Difficulty with consistent contact on irons"), it will suggest a relevant drill.
- **AI-Prompted Learning:** "Your recent data suggests your tempo is inconsistent. Try the 'Half-Swing Rhythm Drill' focusing on the *feel* of a smooth transition."

II. Content Examples (AI-Generated "Feel-Based" Drills - Kinesthetic Emphasis):

Below are examples of how the AI would present "Feel-Based" Drills, emphasizing physical sensation for a Kinesthetic learner:

1. Drill: "Heavy Clubhead Release" Drill (Full Swing Focus)

- **Purpose:** To improve focus on the sensation of the clubhead releasing through impact, promoting better speed and squaring of the face.
- **Instructions:**
 1. Take a golf club and hold it with only your lead hand (left for right-handers, right for left-handers).
 2. Take small, slow swings, focusing *only* on letting the **weight of the clubhead "release" past your lead hand** through the impact zone.
 3. Do not worry about hitting a ball; focus purely on the sensation.
- **Focus on This Feel:** The sensation of the **clubhead being heavy and pulling your lead hand forward**, then swinging past your hand just after impact. Feel the momentum.
- **Practice Goal:** 20-30 slow swings, 5-10 with your normal grip, emphasizing the same feel.
- **Expected Outcome:** A more fluid, less forced swing, with improved clubhead speed and better contact.

2. Drill: "One-Handed Putting Stroke" (Putting Focus)

- **Purpose:** To enhance focus on the feeling of the putter face moving squarely and consistently, and the connection between hands and putter.
- **Instructions:**
 1. Stand over a putt, but hold the putter with only one hand (dominant hand for control, non-dominant for feel).

2. Make short, smooth putting strokes, trying to keep the putter face perfectly square to the target line throughout the stroke.
 3. Hit 5-foot putts, focusing only on the *feel* of the putter.
- **Focus on This Feel:** The sensation of the **putter face staying stable and square** as it travels back and through. Feel the weight of the putter head moving.
 - **Practice Goal:** 10-15 putts with one hand, then 10-15 with two hands, trying to replicate the same feel.
 - **Expected Outcome:** A more consistent putter face and improved directional control, especially on shorter putts.

3. Drill: "Step-Through Tempo" Drill (Rhythm & Balance Focus)

- **Purpose:** To improve focus on dynamic balance and overall swing rhythm, ensuring a smooth weight transfer.
- **Instructions:**
 1. Set up to a golf ball.
 2. As you take your normal swing, allow your back foot to **step through towards the target after impact**, finishing completely balanced on your lead foot.
 3. This exaggerate step helps emphasize the feeling of weight transfer.
- **Focus on This Feel:** The **uninterrupted flow of weight from back to front**, leading to a balanced finish. Feel your body rotating *through* the shot.
- **Practice Goal:** 10-15 swings with this step-through, then return to normal swing, trying to maintain the same feeling of continuous motion.
- **Expected Outcome:** A more powerful and balanced swing, reducing "coming over the top" and improving consistency.

III. UI/UX Considerations:

- **Dedicated "Drills" Library:** A prominent section within the Coach tab, categorized for easy navigation (e.g., "Full Swing Drills," "Short Game Drills," "Putting Drills," "Focus-Specific Drills").
- **Clear Visuals (Static Images/GIFs):** While the emphasis is on kinesthetic feel, accompanying static images or short, looping GIFs can effectively demonstrate the physical action of the drill. These should be minimal and support the text.

- **Concise Instructions:** Text should be easy to read and follow on a mobile device, with bullet points or numbered lists.
- **"Focus on This Feel" Highlight:** A distinct section or bolded text for the kinesthetic focus point of each drill.
- **User Tracking:** Option to "Mark as Completed" or "Log Practice" after a drill session.
- **"Save to Favorites" / "Add to Practice Plan":** Allows users to save drills they find effective.
- **AI Explanation for Recommendation:** Briefly explain *why* a particular drill is being recommended based on the user's data (e.g., "Your recent slice tendency suggests this drill").
