FoCoCo Prime Tier: Real-time Physical Cues - Technical & Content Specification

Feature Name: AI-Driven Real-time Kinesthetic Focus Cues

VARK Modality: Kinesthetic (K)

Pillar: Focus (for immediate in-round self-correction and maintaining presence)

Description: A Prime-tier feature where the AI proactively provides immediate, concise physical cues or prompts to Kinesthetic users based on real-time data and contextual awareness. These cues are designed to trigger a physical reset, bringing the user's attention back to the present moment and re-establishing focus when the AI detects signs of wavering attention or rising tension.

I. Core Logic & AI Integration:

- **Real-time Data Inputs:**
 - **User-Logged Mindset Changes:** If the user manually logs a "Distracted," "Rushed," or "Frustrated" mindset during a round.
 - **Performance Deviations:** (Inferred) AI detects unusual patterns in a short sequence of shots (e.g., string of missed fairways, sudden increase in putts, or deviation from usual shot dispersion), which *could* indicate a focus issue.
 - **Pacing & Time Indicators:** (If available, inferred from user progression through holes) If the user's pace of play significantly slows or speeds up in a specific segment, indicating a mental shift.

- **Biofeedback Integration (Future Potential):** If integrated, real-time physiological data (HRV, HR) indicating stress or disengagement will be a primary trigger.
- **AI Detection Engine for Focus Wavering:**
 - The AI continuously monitors the above data points for deviations from the user's established baselines or optimal patterns.
 - It correlates these deviations with known indicators of focus breakdown for Kinesthetic learners (e.g., skipping routine steps, rushed movements, physical tension).
 - The AI's "Trend Engine" (from companion notes) identifies when a user is entering a "vulnerable" segment or pattern.
- **AI-Generated Kinesthetic Cues:**
 - Upon detecting a potential focus lapse, the AI selects the most relevant and effective physical cue from a library, personalized to the user's VARK profile and past effectiveness.
 - Cues are concise, action-oriented, and immediately actionable. They are drawn from concepts in "Actionable Prompts," "Movement-Based Routine Suggestions," and "Grounding Exercises."
- **Prompt Delivery:**
 - Cues are delivered discreetly and non-intrusively on the app interface during the round.
 - They are designed to be glanced at and acted upon quickly.
- **Effectiveness Feedback (Implicit/Explicit):**
 - The AI tracks subsequent mindset ratings and performance after a cue is delivered to assess its effectiveness over time.
 - Users *could* have a quick "Did that help?" interaction, but the primary goal is minimal disruption.
- **Contextual Triggering:**

- **During Round:** The primary use case. Cues are pushed when relevant data is detected.
- **Post-Round Analysis:** The AI highlights moments where a real-time cue was delivered, its rationale, and the subsequent impact on performance/ mindset.

II. Content Examples (AI-Driven Real-time Kinesthetic Focus Cues):

These are concise, immediate prompts designed for quick physical action and focus shift:

1. **Trigger:** User logs "Rushed" mindset / AI detects unusually fast pace of play or hurried routine completion.
 - **Cue: "Slow your steps. Feel your feet."** (Focuses on the physical act of walking slowly and body awareness).
 - **Cue: "Deep breath. Shoulders down."** (Emphasizes physical relaxation through breath).
2. **Trigger:** User hits two consecutive poor shots (e.g., shanks, pushes) / AI detects a spike in tension (future biofeedback).
 - **Cue: "Clench & release hands."** (Physical tension release).
 - **Cue: "Tap club on shoe. Reset."** (Physical anchor for a mental reset).
3. **Trigger:** User is waiting on a slow group / AI detects a long period of inactivity or a potentially wandering mind.
 - **Cue: "Feel your grip. Notice texture."** (Engages tactile sense to bring focus to the present).
 - **Cue: "Conscious stretch. Reach high."** (Physical movement to break mental stagnation).
4. **Trigger:** Before a high-pressure shot (e.g., 18th hole final putt) / AI detects elevated tension (future biofeedback).
 - **Cue: "Root your feet. Feel stable."** (Grounding exercise for stability).
 - **Cue: "Waggle slowly. Feel the clubhead."** (Focus on the kinesthetic feel of the swing action).

III. UI/UX Considerations:

- **Subtle & Non-Intrusive Display:** Cues appear as a small, dismissible overlay or notification banner at the top or bottom of the screen, designed for quick glanceability.
- **High Readability:** Large, clear font with good contrast against the background.
- **Immediate Action Focus:** The text is the instruction; no need for additional taps to navigate.
- **Optional Auditory Cue:** A very subtle, non-distracting chime or vibration can accompany the visual cue to draw attention.
- **Minimal Interaction:** Users are meant to *perform the action*, not interact heavily with the app. The cue can auto-dismiss after a few seconds or a user tap.
- **Personalization Toggle:** Prime users can enable/disable real-time cues or select specific types of cues they prefer.
- **Contextual Relevance:** Cues are highly relevant to the immediate playing situation.
- **Performance Impact:** The AI will learn which cues are most effective for a given user in specific situations, refining future suggestions.
