FoCoCo Prime Tier (Future): Tactile Feedback Integration - Technical & Content Specification

Feature Name: AI-Driven Kinesthetic Tactile Focus Cues

VARK Modality: Kinesthetic (K)

Pillar: Focus (for subconscious reinforcement and immediate physical re-engagement)

Description: (Future V1.5+ Prime Feature) This advanced feature leverages the device's haptic capabilities (vibration, haptic touch) to provide subtle, real-time physical cues to Prime Kinesthetic users. These cues act as non-intrusive reminders to engage a specific focus technique or physical reset action when the AI detects a wavering in concentration or rising tension, allowing for a more seamless and intuitive mental game intervention.

I. Core Logic & AI Integration (Future Implementation)

- **Integration with Focus Detection:** This feature directly integrates with the AI's existing "Real-time Physical Cues" and "Biofeedback Integration" (if available). When the AI's detection engine (monitoring mindset logs, performance deviations, pacing, or biofeedback) identifies a need for a focus intervention, a tactile cue is triggered.
- **AI-Triggered Haptic Patterns:**
 - The AI will select a specific haptic pattern (e.g., a short single pulse, a prolonged buzz, a rhythmic tap sequence) based on the detected focus issue and the intended physical response.

- Different patterns can be associated with different types of focus techniques (e.g., one pattern for a "reset," another for "grounding," another for "tempo").
 - The AI can learn which haptic patterns are most effective for a given user in specific contexts.
- **Personalized Haptic Library:**
 - A curated library of distinct haptic patterns is developed, each associated with a specific type of mental cue or physical action.
 - Users (or the AI) can link specific haptic patterns to certain physical focus techniques they find effective (e.g., "When I feel rushed, give me a quick, gentle double-tap to remind me to slow my breathing").
 - **Subtle & Non-Verbal:** The primary advantage for Kinesthetic learners is that these cues are physical and non-verbal, allowing for immediate, intuitive response without needing to look at or interact with the screen.
 - **Effectiveness Tracking:** The AI tracks subsequent user mindset, performance, and routine adherence to infer the effectiveness of the haptic cue in prompting a focus shift.

II. Content/Display Elements (Future Implementation - Kinesthetic Emphasis)

1. **No On-Screen Visual Prompts (Primary):** The core of this feature is the *physical sensation* from the device, reducing the need for visual distraction during play.
2. **Associated Mental/Physical Action:** While the cue itself is tactile, the user will have previously learned what physical action or mental technique is associated with each specific haptic pattern (e.g., a rhythmic pulse means "focus on your breath," a single strong buzz means "physical reset").
3. **Haptic Pattern Library:**
 - **"Gentle Tap":** Short, single vibration (e.g., for "Feel your feet").
 - **"Rhythmic Pulse":** Series of slow, steady vibrations (e.g., for "Deep breathing/tempo").

- **"Sharp Buzz":** Quick, strong vibration (e.g., for "Physical reset/release tension").
 - **"Extended Hum":** Longer, continuous vibration (e.g., for "Hold/release a stretch").
4. **In-App Reference/Learning:** Users can access a section in the app to "Feel the Cues," allowing them to experience each haptic pattern and understand its associated focus technique.

III. UI/UX Considerations (Future Implementation)

- **Device Compatibility:** Requires robust integration with device haptic engines (e.g., iOS Taptic Engine, Android haptics) across various phone and potentially wearable models.
- **Customization:** Prime users can enable/disable tactile feedback globally and customize specific haptic patterns linked to certain focus techniques or triggers.
- **Discreetness:** Haptic feedback must be subtle enough not to disturb playing partners or draw undue attention. Vibrations should be felt by the user but not audible to others.
- **Battery Life Consideration:** Haptic feedback can impact battery life; optimization will be crucial.
- **User Training:** An initial onboarding phase or a dedicated "Learn Your Cues" module will be essential to teach users what each haptic pattern signifies and how to respond physically.
- **Contextual Intensity:** Potential for AI to adjust the intensity or frequency of haptic cues based on the severity of the focus lapse or the sensitivity of the situation.
- **Feedback Loop Integration:** A simple mechanism for users to confirm (post-round) if a specific haptic cue successfully prompted a focus shift.
